#### 1.1 Présentation

Le Marine IOT Gateway

Le Marine IOT Gateway est un calculateur industriel robuste, connecté, ouvert et customisable qui permet :

- D'interfacer des capteurs, actionneurs et calculateurs utilisant divers protocoles (RS232, RS232+PPS, NMEA0183, RS485/Modbus, RS422, USB, CANbus, NMEA2000, J1939, CANOpen, UDP, TCP, MQTT, DDS, zeromq... protobuf)
- De réaliser des calculs et interfaces en temps réel (Navigation, Contrôle commande...)
- De fournir une IHM distribuée sur tous vos navigateurs web et afficheurs MFD HTML5 du bord.
- De datalogger
- En option : De communiquer à distance (4G, Lora, Kineis, Swarm Technologies, Iridium, Starlink...)

Cette passerelle intègre un puissant microcontrôleur industriel, de nombreuses interfaces, un OS temps réel, et est durcie (Marinisée, Gamme de température étendue, Isolations galvaniques, CRC Flash et SRAM...).

Le calculateur est conçu afin d'obtenir un système temps réel dur, plus robuste qu'une solution Linux Preempt RT:

- Temps de boot et watchdog ultra court (<< 1s)
- Mémoires non volatiles robustes avec vérification de l'intégrité possible (FLASH, FRAM)
- Latence des interruptions très faible : 48ns à 10µs (série, timer...)
- Fréquence des boucles de calculs et acquisitions jusqu'à 1Khz

#### 1.2 Applications

Marine, Industrial and transportation IOT: IOT Gateway, Data collection, Fleet management, Asset Monitoring, Machine Monitoring, Overall Equipment Effectiveness (OEE) Monitoring

Mission Critical application:

marine application : Contrôle d'attitude, Flight Control System,

robotics, transportation and industrial automation

#### 1.3 Développement logiciel

Nous vous fournissons avec les produits, les tutoriels d'installation des outils et de développement ainsi qu'un template, afin d'intégrer au plus rapidement votre code propriétaire, par vous-même ou épauler par Austral Electronics.

Le Software Development Kit (SDK) est basé sur des outils open sources adoptées par la grande majorité des développeurs professionnels :

- Configuration du microcontrôleur via l'outil graphique STM32CubeMX
- Plus de 150 briques logicielles disponibles via les 'STM32Cube expansion packages' (IA, CANOpen ...)
- Bare-metal ou OS temps réel : FreeRTOS
- Pile TCP/IP: LwIP
- IDE : Visual Studio et ses nombreuses extensions via le 'Visual Studio Marketplace'
- Logiciels écrits en C/C++ (Rust possible), Pages Web en (HTML, CSS, JavaScript côté client)
- Debug: Sonde ST-LINK/V2, Bootload: USB, Serial

IDE Visual Studio

Au besoin, AUSTRAL Electronics peux vous accompagner dans votre design :

- Expertise NMEA2000, contrôle commande
- Extension Hardware
- Safety-critical systems : SafeRTOS, QP™ RTEFs
- IOT : Azure RTOS, Zephyr OS
- Model-based Design for Safety standards : Qp Modeler

Génération de code automatique à partir de graphes UML

- (1) The calculator is powered by the NMEA2000 (Reverse battery protection and Internal SMT fuse)
- (2) Regulated 12V output from an internal isolated DC/DC converter (6W max)
- (3) 5V Input (2W) / !!! Warning Do not connect to a voltage >5V !!!
- (4) The 100/120 ohm terminator is not include
- (5) The 120 ohm terminator is not include
- (6) !!! Warning Receiver Input voltage : -8V to +12.5V max !!!

## 3.2 CANBus
